

### InkMark™ UV-DTF Film

Direct-to-object printing, while extremely flexible, can occasionally encounter limitations. No need to invest in additional specialized equipment, DCS now offers a complete solution for DTF called UV-DTF. The system is available in clear, silver and gold films and is packaged as a 2-part system that includes sheets for the A side and a roll for the B side.

Use UV-DTF for oversized or odd shaped objects, drinkware with handles, difficult to stick to substrates and surfaces that are overly reflective.

Compatible with all DCS ink sets and available from Direct Color System's InkMark Materials.

The application of UV-DTF is easy and the results are durable. The only additional item you need is a low cost thermal laminator.

#### STEP 1

Print using any DCS ink set to film A using the DTF Queue in ColorByte

#### STEP 2

Laminate the printed sheet to film B using a thermal laminator on specified setting

#### STEP 3

Trim individual graphics and apply to the object, use a squeegee or card to burnish the graphic into place

#### STEP 4

Peel the film away from the graphic,
